

02/02/2026:

-Modification of the code:

The input for the llm was not well formatted and there were errors in the code

-Test on the first finetuned model and on the baseline (no finetuning) on NLI4CT:

The baseline always predict Contradiction

The finetuned model achieve a 60% accuracy (look at the output_qwen05b_finetune file)

04/02/2026:

Implementation of LoRA 4bit (a lot of errors and conflicts with bitsandbytes, it took 2h to correct the problem and have a code which is working)

Test of the baseline model on NLI4PR (same problem as NLI4CT, always predict contradiction)

Finetuning of the same model with our fully working code (with LoRA)
